Notes about 1995 GHS Teaching Data Set prepared by Helen Cooper and Sara Arber, University of Surrey

The data file contains 5,939 adults and children, which is a 1 in 4 sample of the 1995/96 GHS (larger file - ghs95.sav). There is also a smaller file (ghs95b.sav) containing about 1200 cases, which is a 1 in 5 sample of GHS95.sav. Both data files contain the same 64 variables. The original ONS hierarchical GHS files held in SIR were used to create these SPSS data files.

Sample Design and Sampling Error

Interviews were conducted between April 1995 and March 1996 with each adult - defined as aged 16 and over - in about 10,000 households. A responsible adult, usually the mother, was asked questions about children under 16 living in the household. Interviews were conducted using CAPI - computer-assisted personal interviewing.

The GHS is a two stage national sample of mainland Britain, with a response rate of about 80%. Addresses are selected from the Postcode Address File. A multi-stage sample design results in sampling errors that are almost always larger than for an equivalent sample size selected by simple random sampling (SRS). Therefore, it may be misleading to use significance levels calculated on the basis of SRS. The net effect of a more complex sample design is the ratio of the true sampling error to that calculated using the SRS formula, and is called the design effect.

The size of the design effect depends on the particular variable being analysed. Some variables, such as housing tenure, are affected more by clustering and have a higher design effect than other variables, such as health status, which has a design effect close to 1.00. Design effects are periodically computed by ONS and published in the GHS annual reports.

Level of analysis

In the GHS most variables are at the individual level, but others are at the household or family unit level. Household variables, such as TENURE, VIDEO and PHONE have been attached to each individual in the household. The values on these household variables will, of course, be the same for each member of the household.

Some variables refer to the Head of Household, who is defined by the GHS as the person who owns the property or is responsible for the rent. Where a married couple jointly own/rent the property, the husband is always defined by the GHS as the Head of Household. Variables relating to the Head of Household include EDLEVHH2, HOHECSTA, HOHSCLE, HOHSEX, HOHX and HOHFTPTE.

A number of family units may live in the same household. A family unit may consist of a husband and wife (or cohabitees) and their children, provided the children are unmarried or have no children of their own. A family unit may be a lone parent with unmarried children. Variables relating to the family unit include CHNLT5 and FUT.

For further details about the variables refer to the appendices and the CAPI interview schedule in the back of the annual report - Rowlands *et al.* (1997) Living in Britain: Results from General Household Survey 1995, London: HMSO.

Missing Values

In the SPSS data file and in the Codebook certain categories of variables are defined as MISSING, e.g. category 9, -8 or -9 or system missing. During an SPSS procedure the missing categories will be excluded from the analysis by default.

Valid Cases

Some variables in the data set will appear to have a large number of missing values. These may be because of refusals to answer particular questions, e.g. on income. Other questions are only asked of specific subgroups of the sample, e.g. the education questions are only asked where the respondent is under 70. Information about use of contraceptive methods (e.g. CCMAINM1) and number of live born children (CHLIVBN1) is only asked of women aged under 50 and under 60 respectively.

Continuous Variables

Some variables in the GHS contain a large number of answer categories. Where these are at the interval level of measurement (e.g. age), they have been left in this form in the SPSS system files. However, for ease of reference in the Codebook, these 'continuous' variables have been temporarily recoded into grouped values to show the approximate frequencies. It is important to remember that the values in the Codebook for 'continuous' variables are not included in the SPSS file. The missing values category for 'continuous' variables is as shown in the Codebook (either -8 or -9). The following variables have been left in their continuous form in the SPSS data file and temporarily recoded in the Codebook, AGE, WORKHRS, RESLEN and HOHX.

Finally

The 1995 GHS Teaching Data Set has been prepared solely for the purposes of teaching and student use. Most of the names of variables and value labels are those used in the original GHS files. However, some variables have been recoded for ease of use and may vary from the original GHS data.

Information about obtaining the GHS to use for research purposes and copies of access and undertaking forms are available from the Data Archive, University of Essex, Wivenhoe Park, Colchester, CO4 3SQ. We are grateful to the Data Archive for originally supplying the GHS data and to the ONS for permission to use the GHS.
